

Addepar ↔ Schwab Securities Reconciliation

End-to-end data flow and matching logic

Each security is matched with the highest-confidence identifier its data allows; the ones that don't line up are separated out and flagged with the underlying reason.

Addepar stream

Schwab stream

Matching / processing

Output

Synthetic sample data — no real firm information

Classifying every security

The core of the tool: a status, a confidence level, and — if it isn't a clean match — the reason

Supporting cleanup — CUSIP repair

(surfaced in Notes, not a headline)

Excel mangles some CUSIPs into scientific notation; rebuild them from the ISIN.

mangled

CUSIP = ISIN[2:11] ("US" + 9-char CUSIP + check digit)

Status key

- Matched — found in the custodian files
- Matched, flagged — matched but a data issue
- Matched (overlay) — resolved by hand
- Unmatched — no custodian record

Worked examples

Every outcome the classifier can produce, taken from the synthetic sample data

Security	Status	Matched on	Reason / note
Microsoft Corp	● Matched	ISIN+CUSIP+Ticker	clean full match
Apple Inc	● Matched	ISIN+CUSIP+Ticker	clean — CUSIP rebuilt from the ISIN (note)
Amazon.com Inc	● Matched	ISIN + Ticker	clean — CUSIP backfilled from Schwab (note)
SPDR S&P 500 ETF	● Matched	CUSIP + Ticker	clean — ISIN taken from Schwab (note)
Berkshire Hathaway B	● Matched ⚠	Ticker only	low-confidence: matched on ticker alone
Meta Platforms Inc	● Matched ⚠	ISIN + CUSIP	ticker differs: Addepar FB vs Schwab META
Municipal Bond 2031	● Matched (overlay)	manual overlay	not in custodian files; Schwab # supplied by hand
Global Macro Fund	● Unmatched	—	held-away: good identifiers, no custodian record
Emerging Micro Cap	● Unmatched	—	ticker not found at the custodian

The Breaks sheet holds the last five rows; the first four are clean matches. “note” items appear in the Notes column, not as breaks.
